

# $^{14}\text{C}$ - AMS

- Introduction
- Identification of  $^{14}\text{C}$
- $^{14}\text{C}$  concentrations
- Remarks for users

**AMS** Accelerator Mass Spectrometry

a method for measuring very small isotopic ratios

„very small“ => radioisotopes

# Basic Considerations

$^{14}\text{C}$  is a radionuclide,  
why not counting the radioactive decay?

# Basic Considerations

$^{14}\text{C}$  is a radionuclide,  
why not counting the radioactive decay?

sample with 1 mg C  $\Rightarrow 5.0 * 10^{19}$  C atoms  
modern sample, i.e.  $^{14}\text{C}/\text{C} = 10^{-12}$   $\Rightarrow 5.0 * 10^7$   $^{14}\text{C}$  atoms  
half life 5730 yrs  $\Rightarrow$  decay probability  $3.9 * 10^{-12} \text{ s}^{-1}$   
 $\Rightarrow$  for the 1 mg modern sample 0.7 decays / h  
low statistical error 50000 counts  $\Rightarrow$  4 years

mass spectrometry (MS) does not wait for decay !!!

10  $\mu\text{A}$  current =  $6.2 * 10^{13}$  ions/s  $\Rightarrow 62$   $^{14}\text{C}$  ions/s

# Limitation of 'classical' MS

- isobaric ions  $^{14}\text{C}^+ = ^{14}\text{N}^+$
- higher charged ions  $^{28}\text{Si}^{2+}$
- molecular ions  $^{12}\text{CH}_2^+$
- resolution (tailing)  $10^{-5}$  level
- $^{14}\text{C}$  intensity
- other background

note: single ones of these problems can be overcome,  
but not all of them simultaneously

# $^{14}\text{C}$ - AMS

- **Introduction**
- **Identification of  $^{14}\text{C}$**
- **$^{14}\text{C}$  concentrations**
- **Remarks for users**

# Limitation of 'classical' MS

- isobaric ions  $^{14}\text{C}^+ = ^{14}\text{N}^+$
- higher charged ions  $^{28}\text{Si}^{2+}$
- molecular ions  $^{12}\text{CH}_2^+, ^{13}\text{CH}^+$
- resolution (tailing)  $10^{-5}$  level
- $^{14}\text{C}$  intensity
- other background

**isobaric ions**

**higher charged ions**

**molecular ions**

**other background**

**$^{14}\text{C}$  intensity**

note: single ones of these problems can be overcome,  
but not all of them simultaneously

# Example of a mass spectra

negative ions

⇒ no  $^{14}\text{N}^-$

⇒ no  $^{28}\text{Si}^{2-}$

isobaric ions

higher charged ions

molecular ions

other background

$^{14}\text{C}$  intensity

Fig. R.Beukens, Radiocarbon after four decades, Springer-Verlag, 1992

# Molecular ions

- ions fly in vacuum ( $10^{-6}$  mbar)
- but hit matter at the stripper

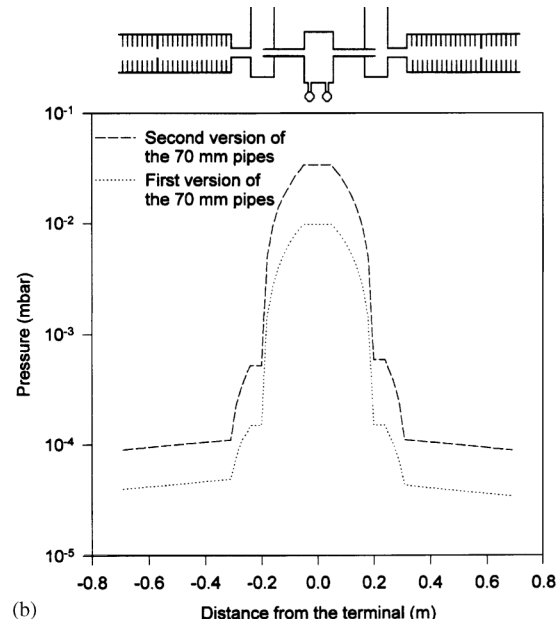

Fig. from P. Person et al., NIM A500 (2003) 55

isobaric ions

higher charged ions

molecular ions

other background

$^{14}\text{C}$  intensity

# Insertion: energy of ions

Highest efficiency for  $^{12}\text{C}^{3+}$  is at 2.5 MeV

$$1 \text{ eV} = 1.6022 \cdot 10^{-19} \text{ J} \rightarrow 1 \text{ MeV} = 1.6022 \cdot 10^{-13} \text{ J}$$

## Electronvolt

From Wikipedia, the free encyclopedia

*meV, keV, MeV, GeV, TeV and PeV redirect here. For other uses, see MEV, KEV, GEV, TEV and PEV.*

In physics, the **electron volt** (symbol **eV**; also written **electronvolt**<sup>[1][2]</sup>) is a unit of energy equal to approximately  $1.6 \times 10^{-19}$  joule (symbol **J**). By definition, it is the amount of energy gained by the charge of a single electron moved across an electric potential difference of one volt. Thus it is 1 volt (1 joule per coulomb, 1 J/C) multiplied by the electron charge (1 e, or  $1.602\,176\,565(35) \times 10^{-19}$  C). Therefore, one electron volt is

isobaric ions

higher charged ions

molecular ions

other background

$^{14}\text{C}$  intensity

# Example $^{14}\text{C}$ with 2.4 MeV in argon

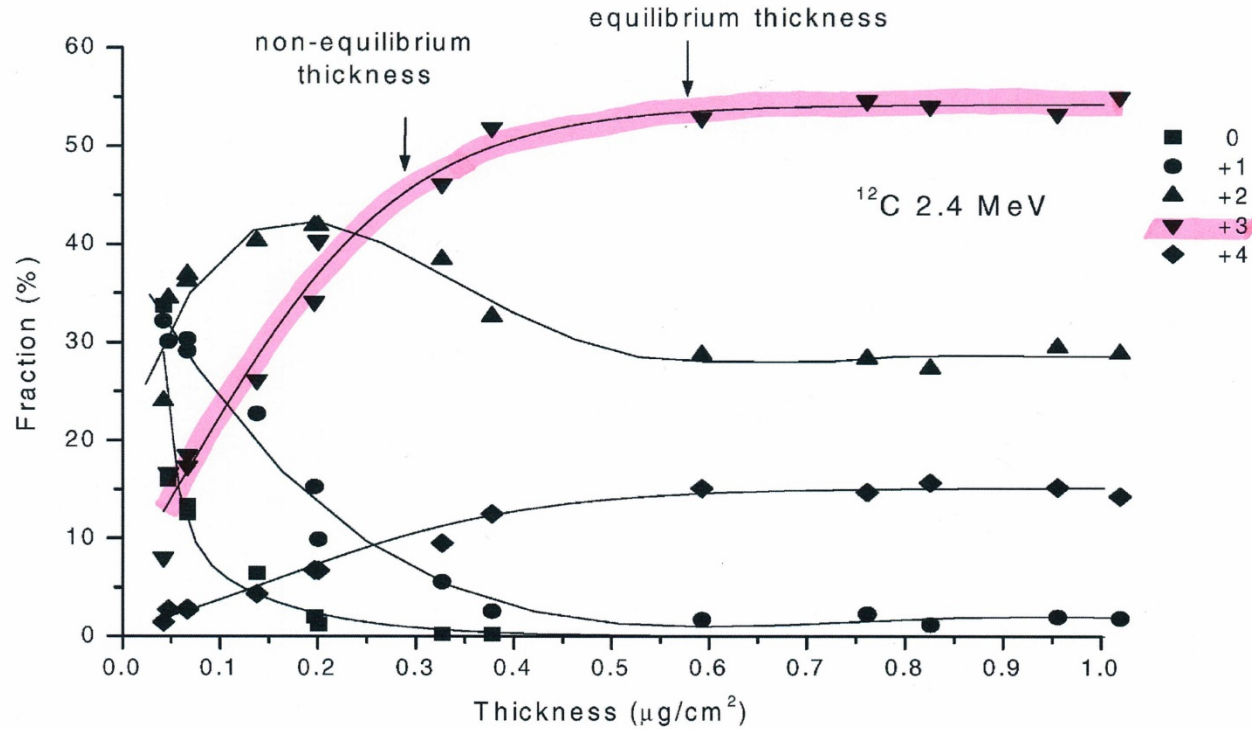

Fig. from M. Kiisk et al. NIM A481 (2002) 1

isobaric ions

higher charged ions

molecular ions

other background

$^{14}\text{C}$  intensity

# Insertion: energy of ions

ground potential

incoming  
C-  
0.035 MeV

potential 2.5 MV

at the stripper  
C-  
2.5035 MeV

ground potential

C+ 5 MeV  
C2+ 7.5 MeV  
C3+ 10.0 MeV  
C4+ 12.5 MeV

isobaric ions

higher charged  
ions

molecular ions

other  
background

<sup>14</sup>C intensity

Second aim of the stripper:

gaining energy

# $^{12}\text{C}$ charge states as function of energy (equilibrium thickness)

isobaric ions

higher charged ions

molecular ions

other background

$^{14}\text{C}$  intensity

molecular ions in  $3^+$  charge state break off

⇒ no background contribution

⇒ used at the old Jena AMS system

## Second way:

molecules are also destroyed by impacts with  
stripper atoms/molecules

thickness >  
equilibrium

thickness for q

side effects:

energy straggling

angular straggling

so why?

isobaric ions

higher charged  
ions

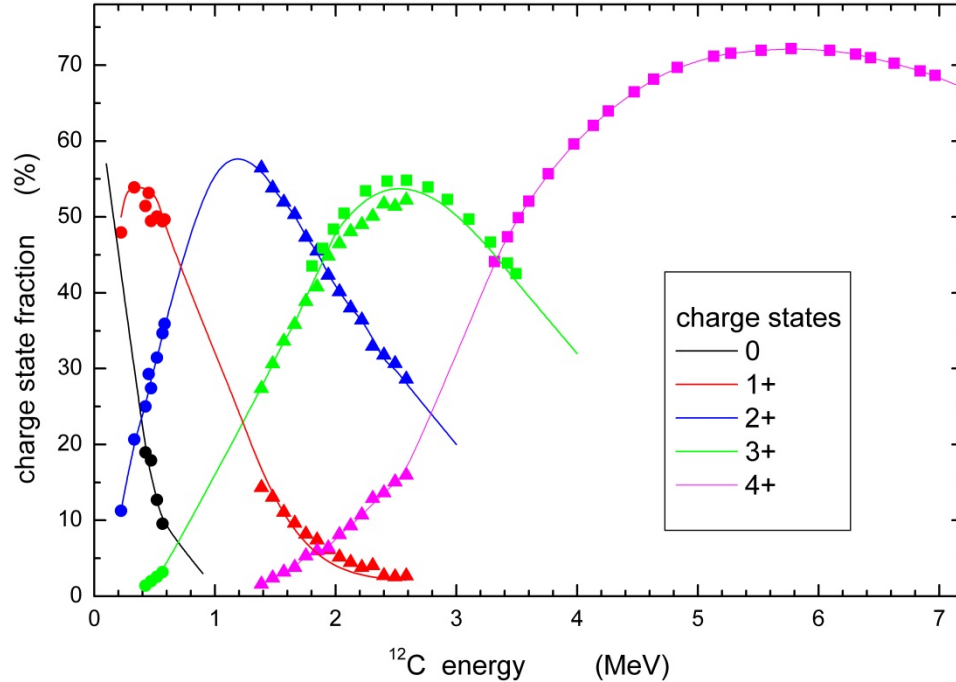

molecular ions

a) charge  $\geq 3+$

b) thick  
stripper

other  
background

<sup>14</sup>C intensity

**isobaric ions**

**higher charged ions**

**molecular ions**

**a) charge  $\geq 3+$**

**b) thick stripper**

**other background**

**$^{14}\text{C}$  intensity**

no molecules  $\rightarrow$  no 3+ charge state  $\rightarrow$  not 2.5 MeV

AMS systems with terminal voltages of

500 or 200 kV possible !!!

(less costs, less space, less ion optical elements)

## Remark: thickness of strippers

these values have large uncertainties ( $\pm 50\%$  ?)

ion energy	molecule suppression	stripper thickness
2.5 MeV	3+ charge state	0.6 $\mu\text{g}/\text{cm}^2$
500 keV	„thick stripper“	2.2 $\mu\text{g}/\text{cm}^2$

table is for argon →

$$1 \mu\text{g}/\text{cm}^2 = 1.5 * 10^{15} \text{ atoms}/\text{cm}^2 = 5.6 * 10^{-3} \text{ mbar m}$$

isobaric ions

higher charged ions

molecular ions

a) charge  $\geq 3+$

b) thick stripper

other background

$^{14}\text{C}$  intensity

# Other background contributions

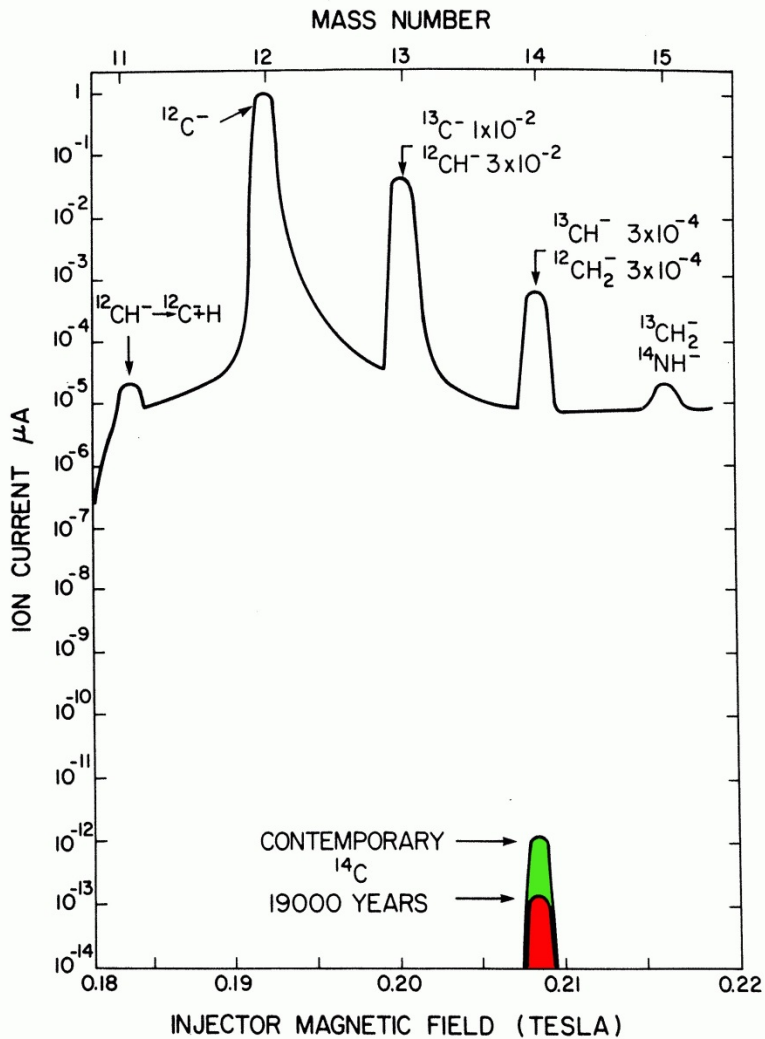

the start →

solved up to  $10^{-5}$

Other processes to be considered

higher energy

reduces tails of peaks

isobaric ions

higher charged ions

molecular ions

other background

$^{14}\text{C}$  intensity

## example for background:

isobaric ions

higher charged ions

molecular ions

other background

$^{14}\text{C}$  intensity

two „unlikely“ processes

but relevant for an *IR* of  $10^{-12}$

# One solution is the detector

energy loss  
of ions in  
matter  
depends  
on the ion &  
its energy

isobaric ions

higher charged  
ions

molecular ions

other

background

$^{14}\text{C}$  intensity

# Detector

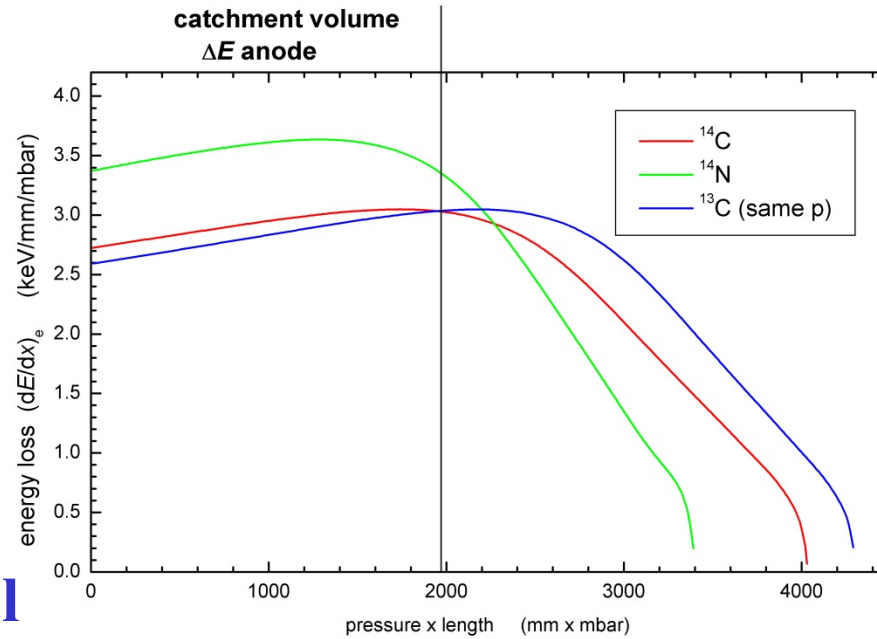

ionisation chamber

signal  $\sim$  energy loss

more precise:

signal

$\sim$  energy loss integral

isobaric ions

higher charged ions

molecular ions

other

background

$^{14}\text{C}$  intensity

# Detector

identification of ions  
in  
( $\Delta E$ ,  $E_{res}$ )  
measurements

isobaric ions

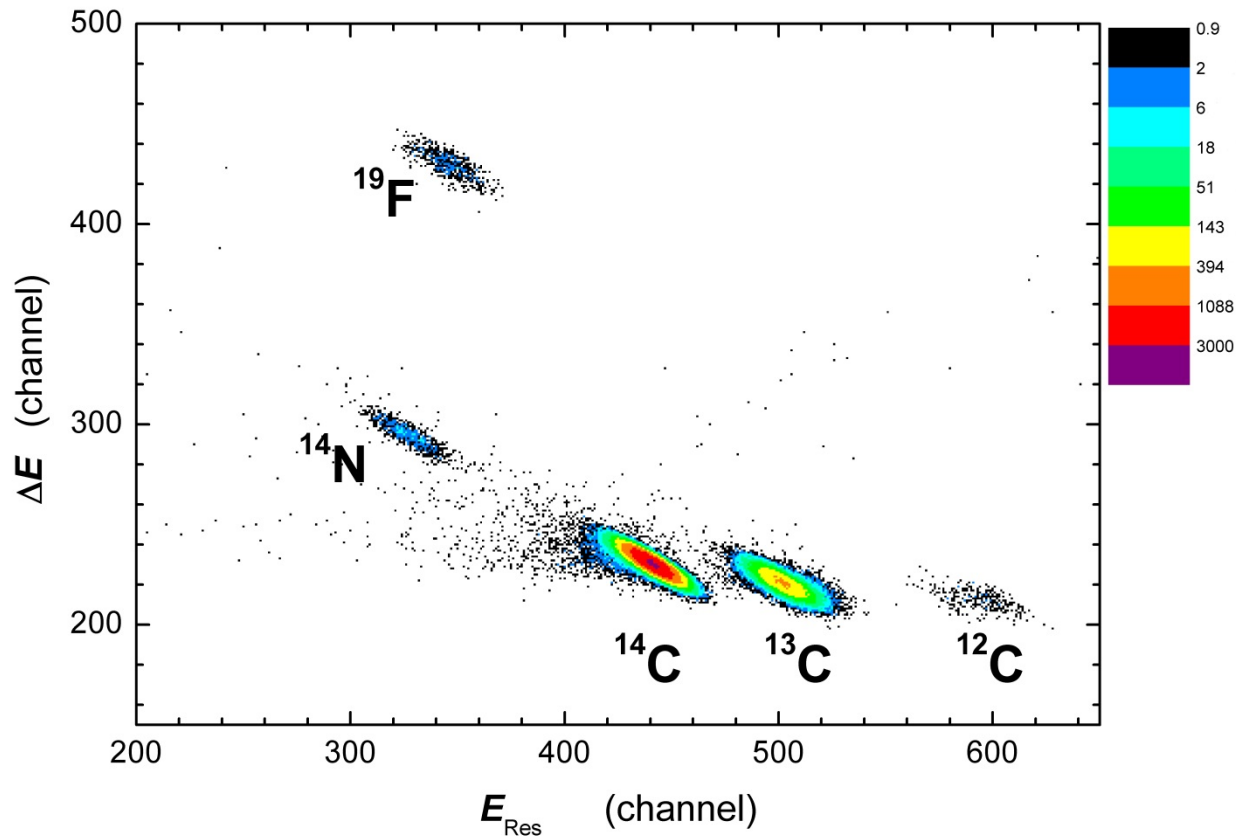

higher charged  
ions

molecular ions

other  
background

$^{14}\text{C}$  intensity

# Detector

isobaric ions

higher charged ions

molecular ions

other

background

$^{14}\text{C}$  intensity

single ion counting  $\rightarrow$   $^{14}\text{C}$  intensity no problem

$(\Delta E, E_{Res})$  not required

# 14C - AMS

- **Introduction** ✓
- **Identification of  $^{14}\text{C}$**  ✓
- **$^{14}\text{C}$  concentrations**
- **Remarks for users**

# $^{14}\text{C}$ concentrations

**lesson learned: identification of  $^{14}\text{C}$**

**wanted  $^{14}\text{C}$  concentrations =  $^{14}\text{C} / ^{12}\text{C}$**

**trick: measurement of the  $^{12}\text{C}$  current**

**like weighing paper-clips  
instead of counting them**

$$^{14}\text{C} \text{ concentration} \propto \frac{^{14}\text{C} \text{ events}}{\int I_{^{12}\text{C}}(t) dt}$$

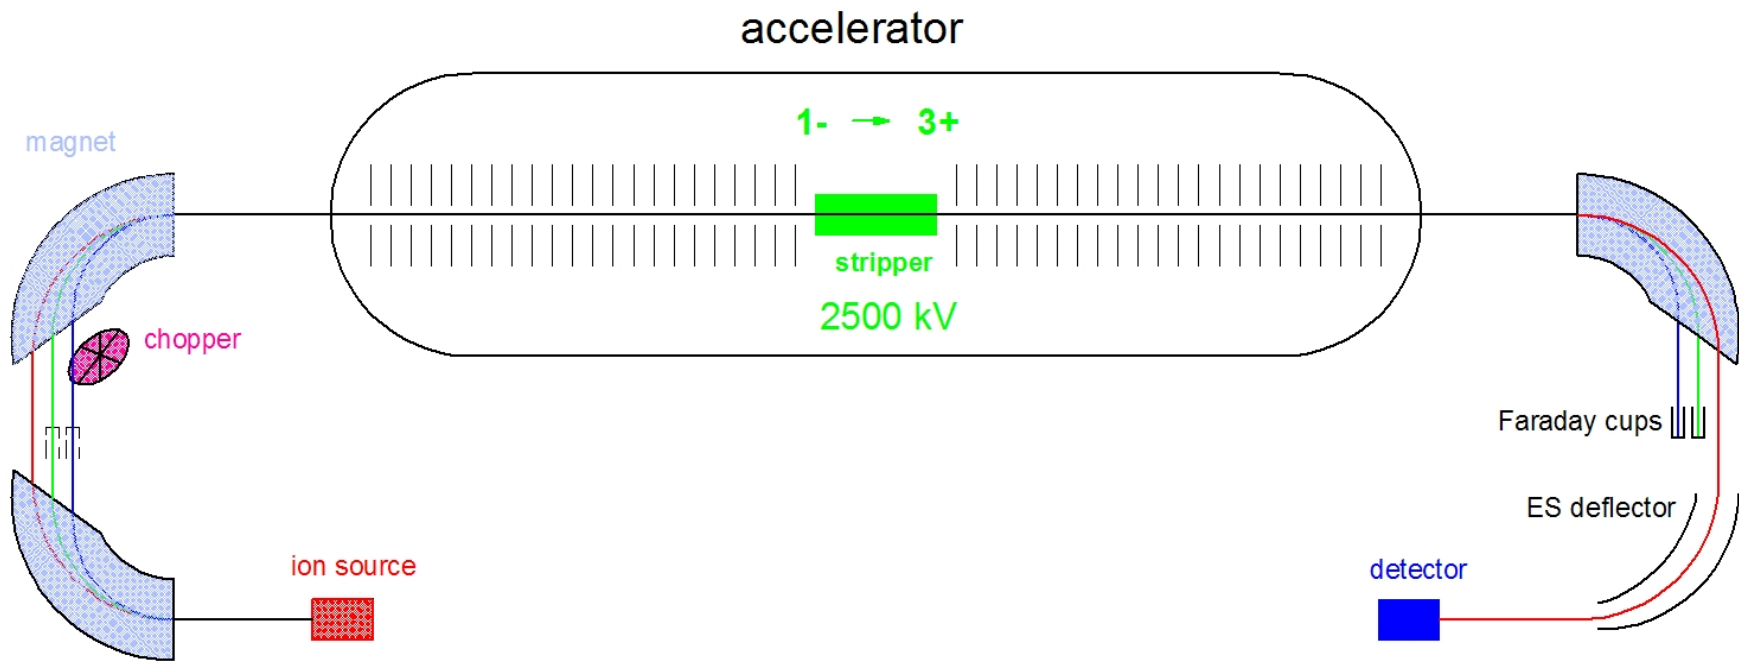

**sensitivity of AMS**

**$10\mu\text{A} (q = 1) \sim 6.2 * 10^{13} \text{ ions/s} = 2.2 * 10^{17} \text{ ions/h}$**

**if  $IR = 10^{-12} \rightarrow 2 * 10^5 \text{ }^{14}\text{C} / \text{h}$**

# dedicated $^{14}\text{C}$ -AMS set-up

this scheme correspond to the old Jena AMS facility

# another dedicated $^{14}\text{C}$ -AMS set-up

This figure shows the MICADAS, a system working with 200 kV terminal voltage

Fig. from H.A. Synal et al., NIM B259 (2007) 7

**There are other major differences among the both AMS systems, e.g. the way to send the  $^{12}\text{C}$ ,  $^{13}\text{C}$ , and  $^{14}\text{C}$  ions to the high energy side:**

**Sequential and simultaneous injection**

**Indirect influence on performance through design requirements on beamline and magnets.**

# $^{14}\text{C}$ - AMS

- **Introduction** ✓
- **Identification of  $^{14}\text{C}$**  ✓
- **$^{14}\text{C}$  concentrations** ✓
- **Remarks for users**

# Remarks for the user

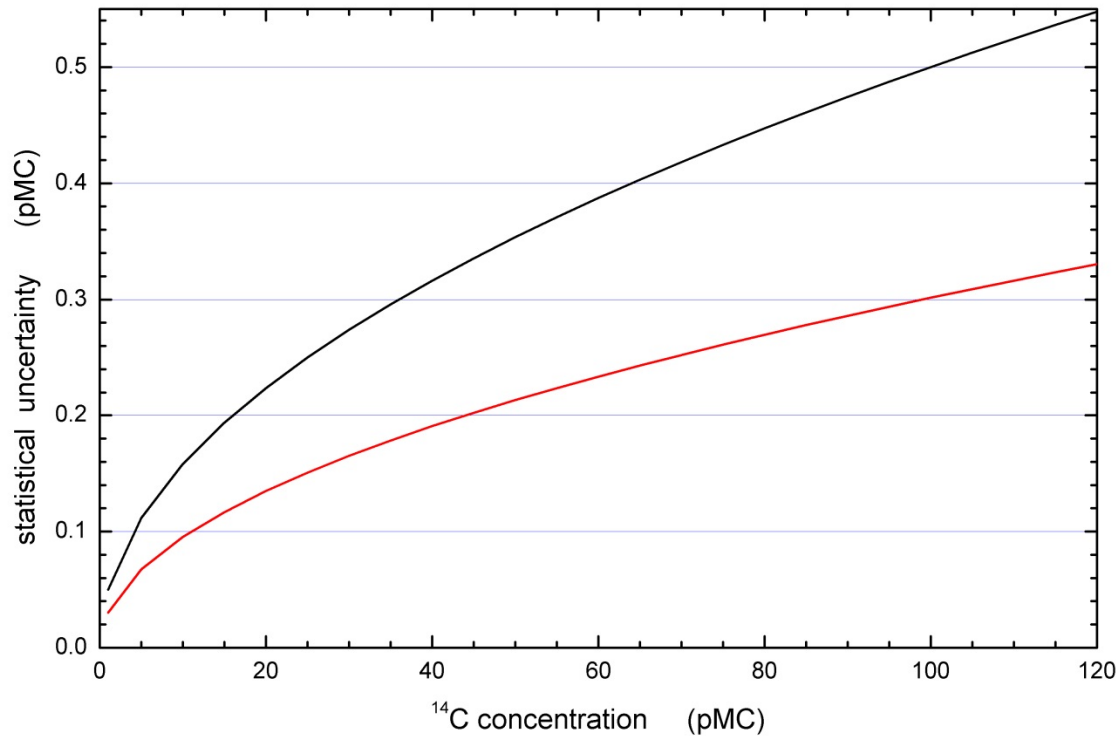

- o A  $^{14}\text{C}$  result is not a number ! Its a value and an uncertainty !!!
- o Not all labs perform all chemical pretreatments
- o For normal requirements the AMS system do not matter.
- o What is „normal“ ?

feature	normal	very good
uncertainty of modern samples	0.5 pMC	0.25 pMC
background of processed sample	0.4 pMC	0.2 pMC
sample mass	1 mg	10 $\mu\text{g}$

Different (background) notations:

$$0.2 \text{ pMC} = 0.002 \text{ F}^{14}\text{C} = 2.4 \cdot 10^{-15} \text{ }^{14}\text{C}/^{12}\text{C} = 50\,000 \text{ yrs BP „conv. age“}$$

**Uncertainties quoted mostly for 100 pMC  
with simple math (only statistical uncertainty):**

**uncertainty based on same effort**

**Black                    0.5 pMC @ 100pMC**

**Red                        0.3 pMC @ 100pMC**

**Thank you for your attention !**

**Tours at combustion lab and AMS system:  
at the respective dates  
out of the elevator at ground floor,  
to the left, door with sign „<sup>14</sup>C-Analytik“**
